t-SNE

- Non-linear dimensionality reduction
 - Compute local neighborhoods in hi-D
 - Model low-D to preserve neighborhoods
 - ➡ Preserves high-D clusters!
- Computationally intensive
- Crowding problem

HSNE - Construction

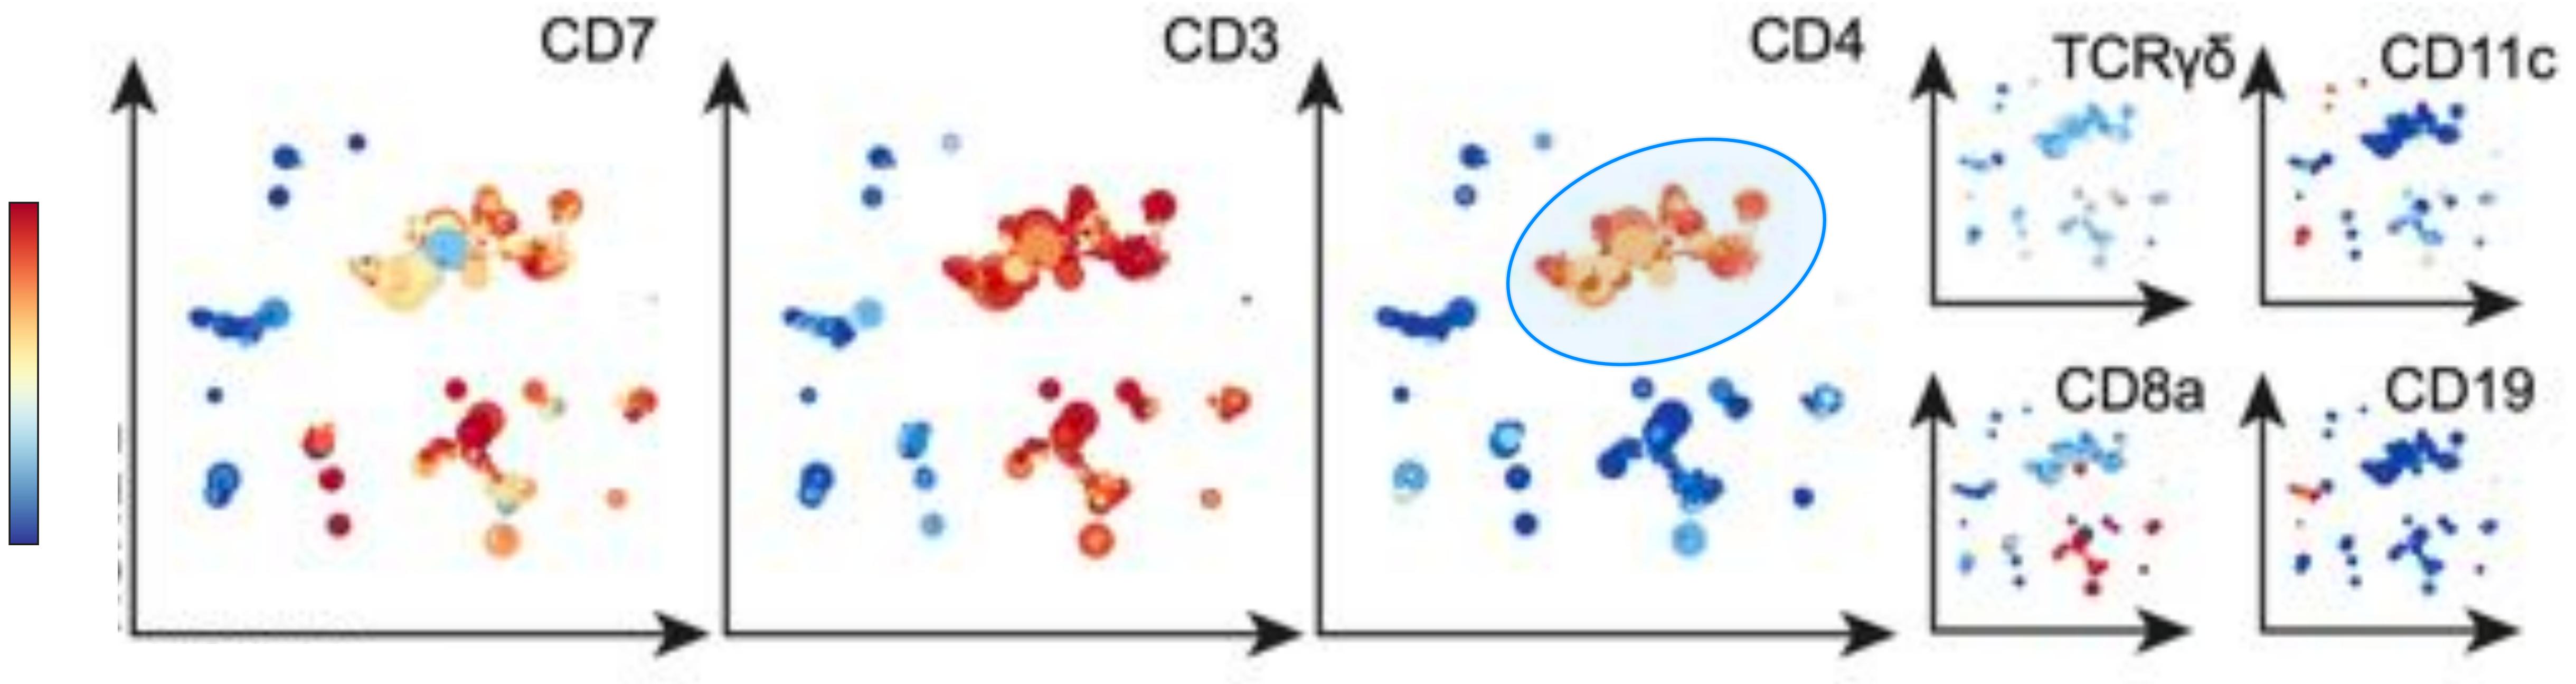

- Aggregate cells by *Landmarks*
- Landmarks selected based on local connectivity in neighborhood graph
- Cells represented by Landmark define Area of Influence (Aol)
- Similarity (above data level) defined by overlap Aol
- Retains non-linearity throughout the hierarchy

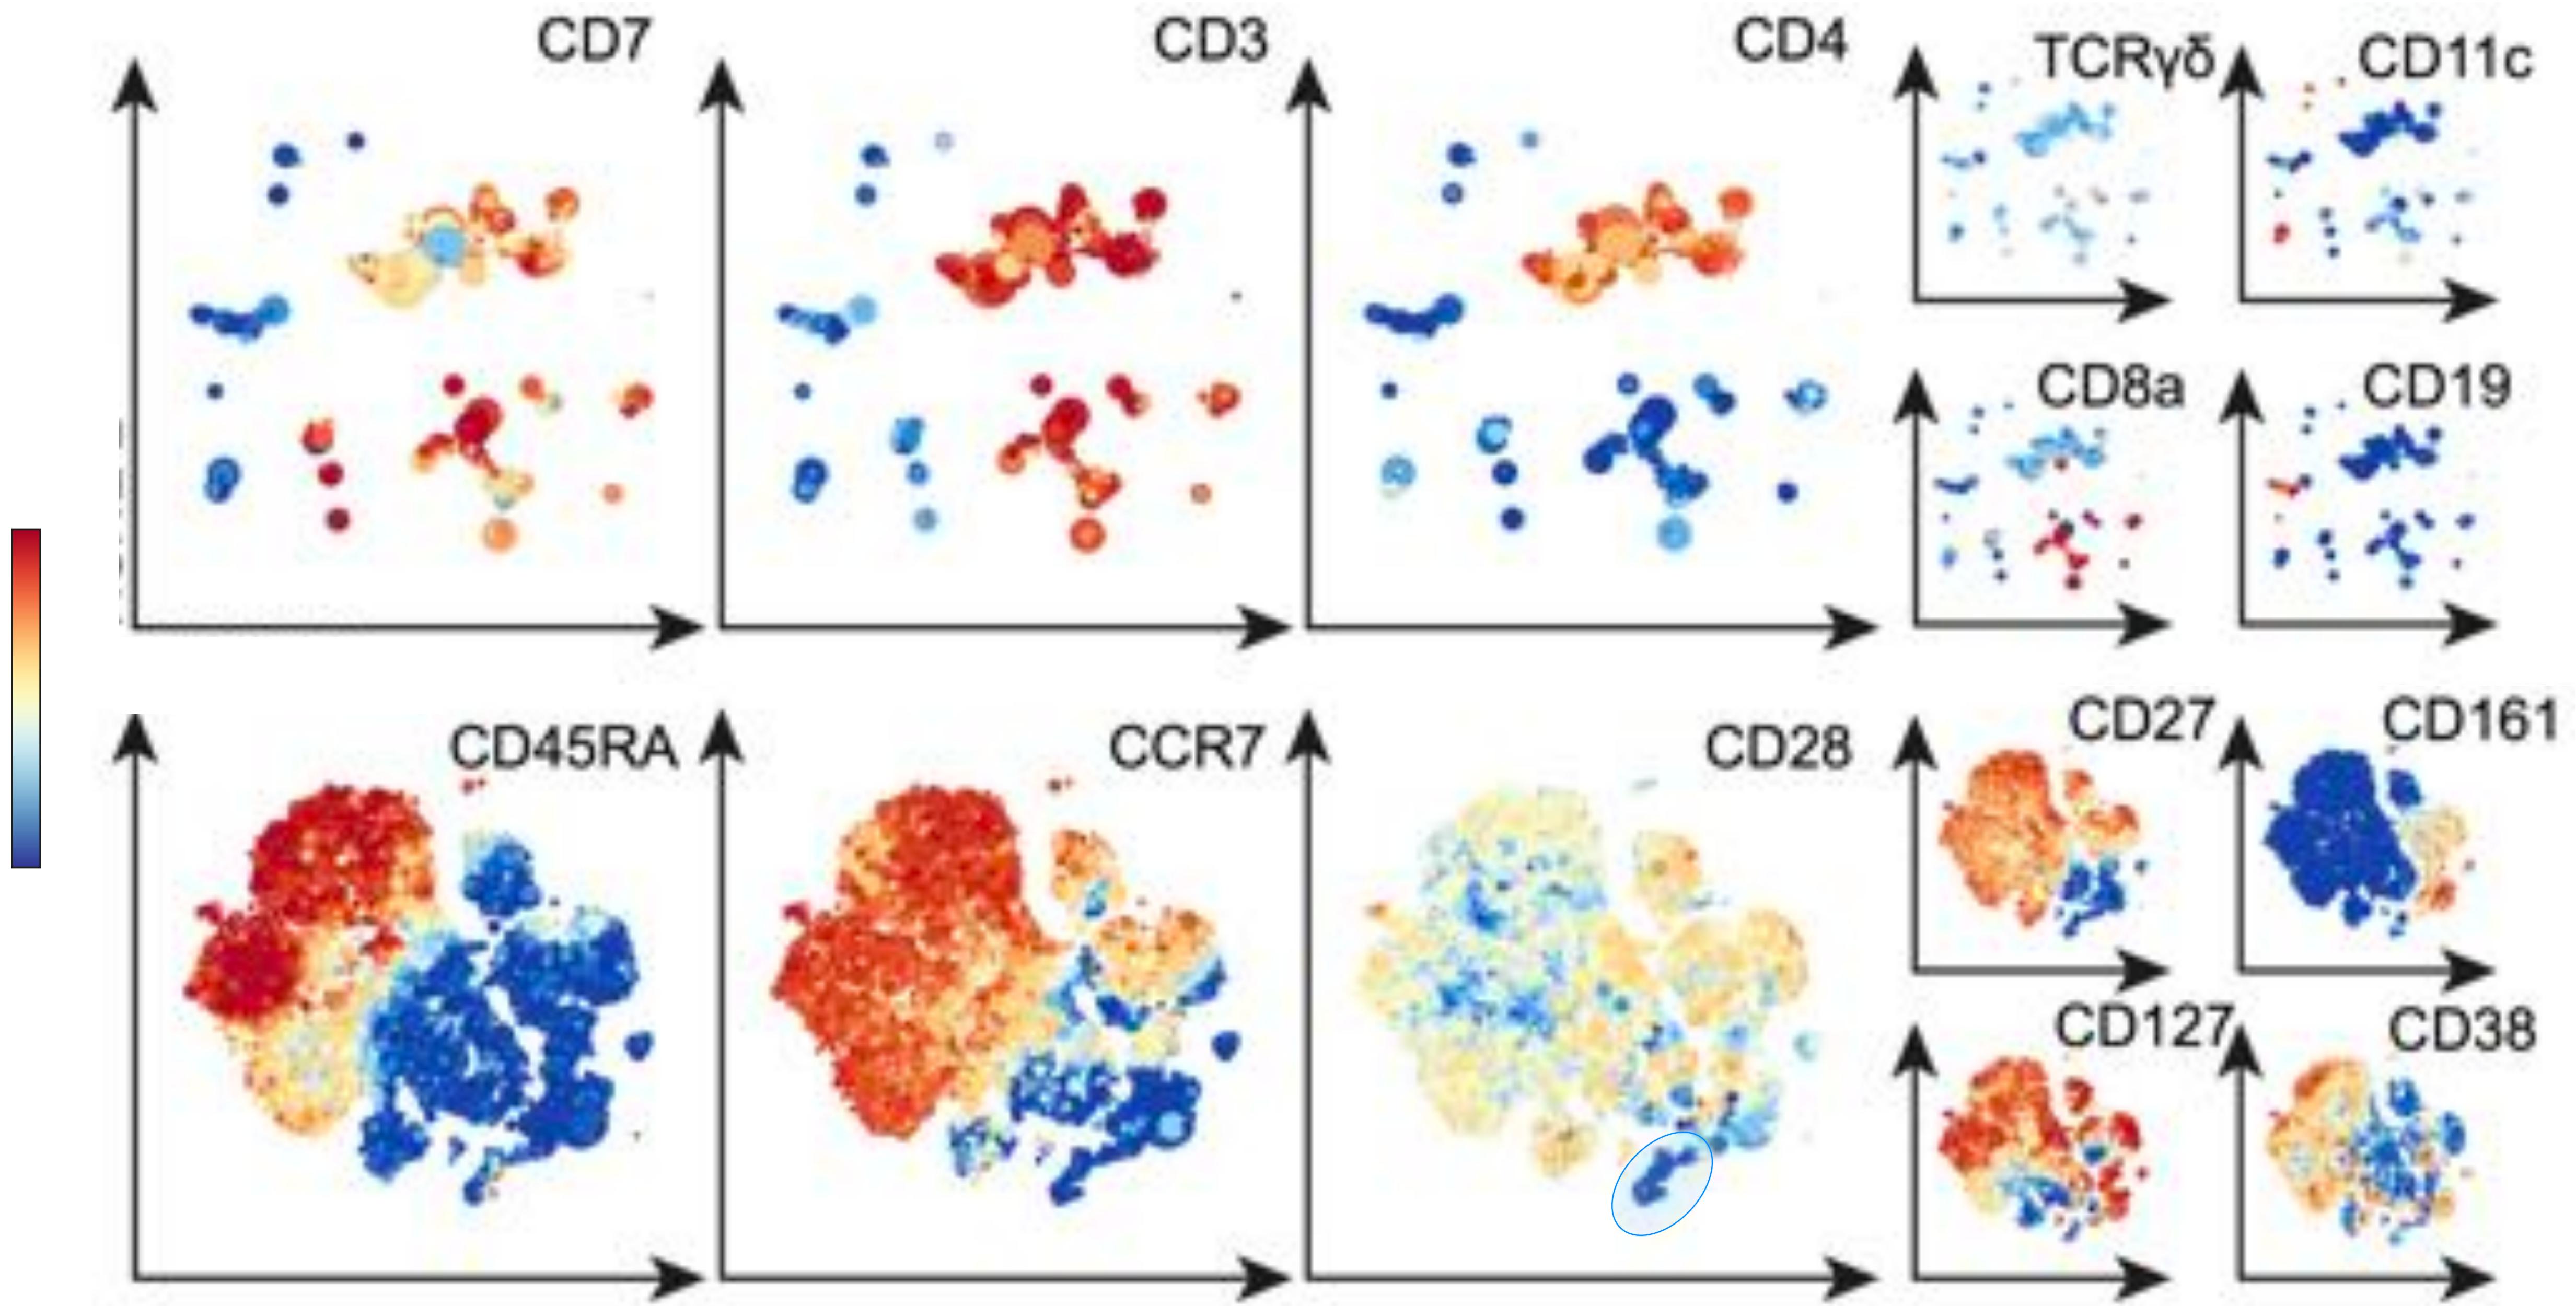

Interactive Exploration

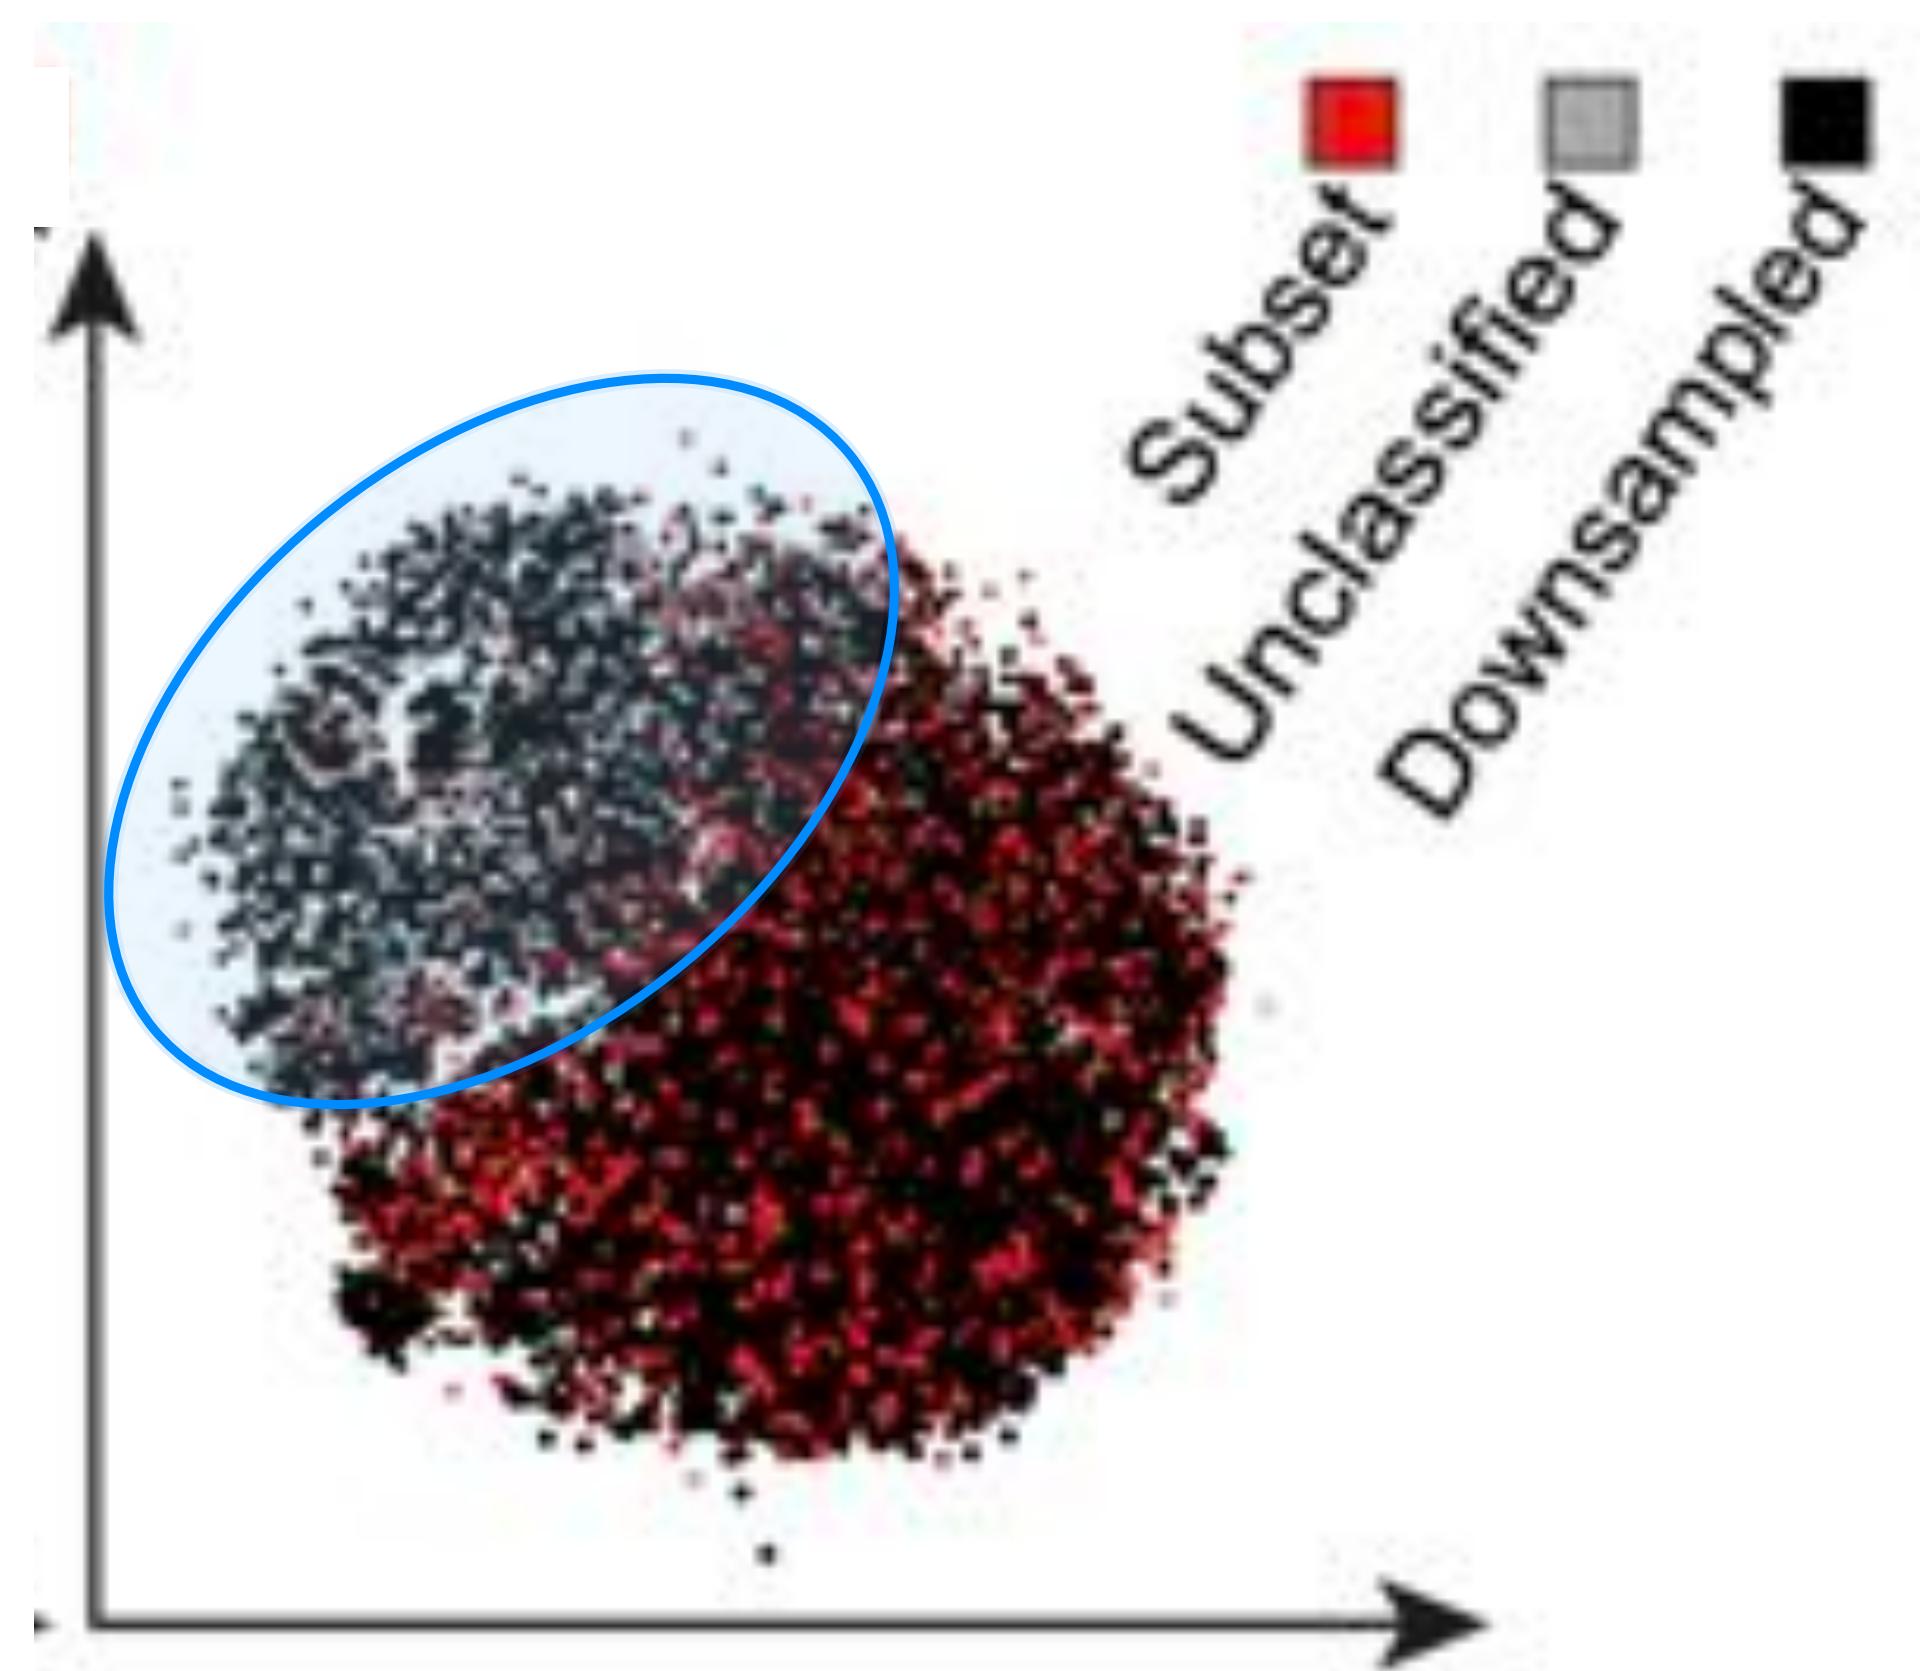

CD4+ T cells in blood and intestine

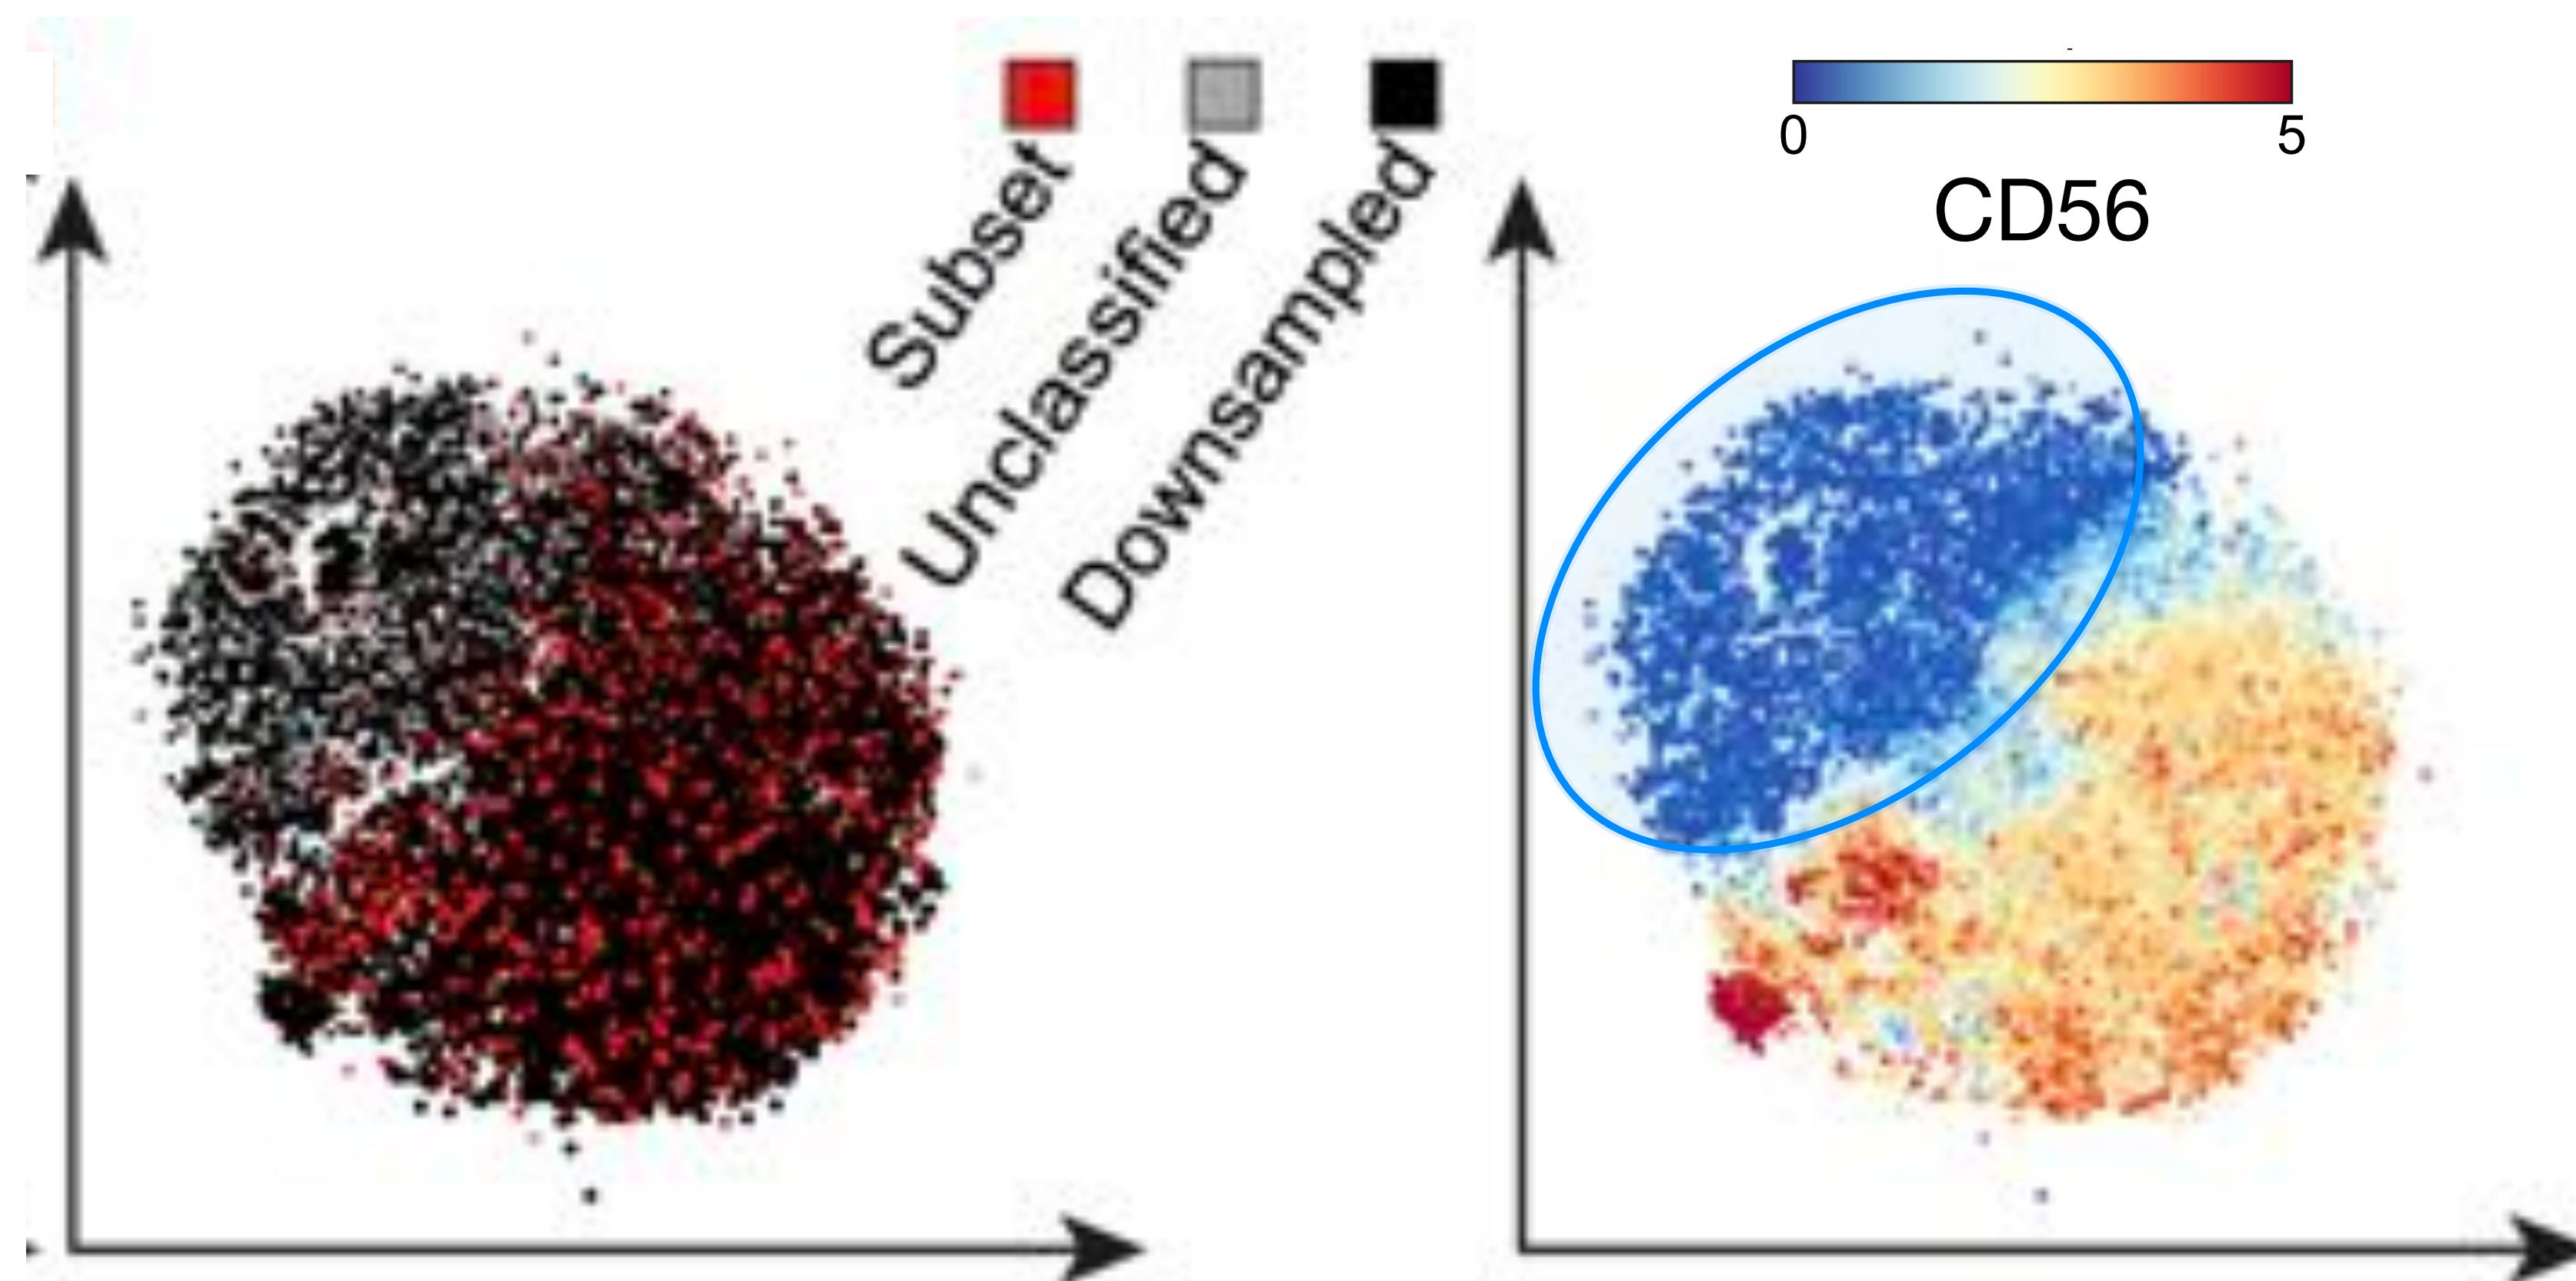

- Single-cell mass cytometry dataset on gastrointestinal diseases
- 5M cells, 40 dimensions (simultaneously measure proteins)
- Less than 30 minute computation time
